**BEEF CATTLE
IMPROVEMENT PROGRAM**

1966 ANNUAL REPORT

ANNUAL REPORT

NORTH CAROLINA BEEF CATTLE IMPROVEMENT PROGRAM

The North Carolina Beef Cattle Improvement Program has as its major objective to assist the cattle producer, both purebred and commercial, in collecting, analyzing and using performance records as a tool for improving their cattle.

This program is a cooperative effort between the North Carolina Cattlemen's Association and the North Carolina Agricultural Extension Service.

ANNUAL REPORT

2

NORTH CAROLINA BEEF CATTLE IMPROVEMENT PROGRAM

GET-OF-SIRE-REPORT

This report is a complete summary of the performance records on all cattle tested during 1966. The data is listed in the form of sire averages and herd averages ranked numerically within breed and creep treatment. Breeds are further classified as Purebred and Commercial. A majority of one breed, treatment or type within the herd determined the classification of the herd for reporting the performance.

The summary of postweaning (140 Day) feeding tests for bulls is listed in the form of sire averages. There is a sire average for each test group. Sires are designated by the tattoo number or by a code number assigned by the producer.

This report includes records on 9,755 calves. These calves were sired by 290 Angus, 434 Hereford, 20 Shorthorn, 19 Santa Gertrudis, 35 Charolais, and 28 bulls used for cross-breeding work. This represents 283 herds in 75 counties in North Carolina.

There were 44 producers who fed 299 bulls on the 140 Day Post-Weaning Test. These tests were conducted on the producer's farm.

The greatest use of this report can be made by those who have their cattle on the program. Between-herd comparison should only be made on a very general basis. The program is not designated or intended for close between-herd comparison since feeding, management, and climate conditions vary from farm to farm, area to area and season to season. Performance is influenced greatly by these factors.

The purpose of the program is the comparison of the performance of individual animals and average sire performance within a herd where feeding and management are the same. The adjusted differences in the performance within a herd can generally be assumed to be largely genetic. Decisions made on these differences is the basis of improvement.

This record is broken down into two parts.

PART I. Evaluation of cow production and calf performance on basis of the calf's average daily gain and type score.

Weight and grade taken on all calves at an average age of 205 days, (145 - 265).

1. Weights. . . The rate of gain from birth to weigh date is calculated and adjusted for age of dam and sex of calf and season of birth. The adjusted average daily gain is a good indication of: (a) The inherent growth ability of the calf, and (b) the milking and mothering ability of the dam. This rate of gain can be used for evaluating both the individual calf and as an indicator of the kind of job the dam and sire are doing.

2. Grade. . . This is a visual evaluation which is placed on each calf by a grader. The grades are divided into thirds of the grade, and numerical numbers are assigned to each. (Fancy - 17, 16, 15; Choice - 14, 13, 12; Good - 11, 10, 9, Medium - 8, 7, 6; Common - 5, 4, 3.) This grading system is designated to evaluate each animal relative to its meat producing potential and its breeding merit. This grade is used for evaluation of the individual calf and as an indicator of the kind of job the sire and dam are doing.
3. Corrections. . . Before a fair and valid comparison between calves can be made, corrections for age in days, sex of calf, and age of dam and season of birth must be made.
 - A. Age in days for the calf is eliminated by the use of average daily gain.
 - B. Sex of calf is accounted for by reducing all bull calves' rate of growth by four per cent and increasing all heifers' rate of growth by eight per cent. This puts everything on a steer basis.
 - C. Age of dam - calves from cows 6-10 years old are unadjusted. Calves from young cows under 6 and cows over 10 are adjusted upward slightly to bring them to a mature equivalent.
 - D. Season of birth - calves born from June 1 - November 30 are slightly adjusted upward.
4. Index. This is a numerical number arrived at by combining both rate of gain and type.
Index for gain = $40 \times$ adjusted daily gain - 18
Index for type = $5 \times$ type score
Total index = index for gain + index for type

PART II. Evaluation of individual performance after weaning by use of one of the following:

1. 140 Day Feed Lot Test . . . Used for bulls only. The bulls are put on feed after weaning and the rate of gain while on test and the grade at the end of the test are combined into an index. This evaluates the individual feed lot gaining ability of the bull. The final weight minus birth weight is used to calculate the continuous growth from birth to end of test.
2. 18-Month Test. . . Used for replacement heifers. This test involves the weighing and grading of the calves when approximately 18 months old. The rate of gain from birth to 18 months is combined with the grade to give an 18 months index. This index can be used to make the final selection before the breeding season.
