

ANNUAL REPORT
OF THE
OFFICE OF SWINE EXTENSION
NORTH CAROLINA STATE COLLEGE OF AGRICULTURE AND ENGINEERING

Fiscal Year Ending November 30, 1928

W. V. Hays, Field Agent

W. W. Shay, In Charge

Believing, as we do, that thore understanding of a problem and its related conditions is necessary to successful leadership in connection with it, the annual report of this office consists this year, as usual, mainly of figures.

The following excerpt from an editorial is quoted from a periodical with a national circulation of over two million copies: "Science has been going ahead by running leaps. Unfortunately for the casual and easily daunted reader, modern science is written in the language of mathematics---lack of easy familiarity with higher mathematics is a formidable obstacle between our ignorance and any real grasp of the modern conceptions of the universe we live in; and that obstacle will continue to bar our paths until the extraordinary importance of mathematical studies receives full and practical recognition."

While a knowledge of higher mathematics is not necessary for a thore understanding of the facts set forth in this report, a clear conception of them can be obtained only as a result of careful study; a brief glance at the figures in a chart or graph without comprehension of their significance is not enlightening, and will be of little if any value to the reader, yet the facts given in this and former reports altho vital to the industry upon which they bear apparently receive scant attention when given out. Without a knowledge of these facts as a guide to operations, consistent progress in the production of market hogs under the conditions which exist in North Carolina is impossible, and that line of farming will continue to be spasmodic, unstable, erratic, and unsatisfactory until the economic effect of un-intelligent feeding and a disregard of the average seasonal price trend are understood and appreciated--merely keeping hogs is not sufficient.

The constant and almost universal advice to "Feed about a half-ration or concentrates to hogs on good pasture" is undoubtedly based on a superficial study of the results of such feeding.

Occasionally an attempt is made to bolster up such advice by reference to the average seasonal price trend of corn, which is another economic fallacy when considered in connection with a well-balanced, systematic plan by which the number of hogs kept on a given farm is adjusted to the estimated amount of corn to grown on that farm which will be available for them.

Only when income is computed from net receipts divided by the labor employed in their production rather than from gross receipts per acre, can the agriculture of the State progress materially.

In order to make such a computation, records are necessary.

This office is indebted to eleven county agents for such records last year, and the result of such demonstrations is shown in the attached Form 10B. We are also deeply indebted to the commission merchants of Baltimore and Richmond for copies of account sales of hogs shipped from this State--analysis of the sales covered by these accounts appear later. Unfortunately, not all shipments are accounted for, but the number so covered is sufficient to show a dependable cross section of what really happened, and point again to the fact that frequently the spread between high and low prices is greater during the twelve months of a year than it is from one year to another, and thus emphasize the importance of so adjusting operations as to profit by the average seasonal price trend.

The feeding and marketing of hogs in North Carolina has been brought to its present proportions by well-conducted feeding demonstrations. It is, therefore, with deep regret that we note the discontinuance of feeding demonstrations in several counties and its effect on this line of work in such counties, and in the aggregate as brought out by the attached analysis of shipments during the last year.

During 1927 there were 403 feeding demonstrations started in twenty-one counties, 153 of which were completed. During 1928 there were 68 such demonstrations completed in eleven counties. In this connection it is worthy of note that the two counties in which there was the greatest increase in the number of hogs sold were also the two counties with the largest number of demonstrations, while on the other hand the greatest decrease occurred in those counties where feeding demonstration work had been discontinued.

It is, of course, realized that there is some disagreeable physical labor connected with feeding demonstrations, but the importance of the work certainly justifies it, and seldom, if ever, has there been a year when conditions were more favorable for a clear demonstration of the economic value of Swine Extension work than are the conditions with which we are confronted this year.

STATISTICAL REPORT OF TRAVEL, MEETINGS AND PUBLICATIONS.

Articles Written	Visits to:			Meetings attend-	Letters		Office calls	Graphs and forms	Travel

It is a practice of this Office to assemble information regarding the results of one or more methods of handling a certain phase of the business of feeding and marketing hogs, arrange it in the form of a table, chart or graph, sufficiently condensed to go on one sheet, then have it mimeographed for distribution under a form number. Specimens of such forms appear in the following pages.

Value of daily gain, cents		7.41	10.00	11.90	13.16	14.70	15.63	16.67	17.86	\$19.50	17.86	17.86	17.86
Av. daily cost of feed, cents		4.22	5.60	6.62	7.53	8.53	9.13	9.93	10.79	\$11.27	11.00	11.29	11.57
Av. daily profit, cents		3.19	4.40	5.28	5.63	6.17	6.50	6.74	7.07	5.34¢	6.86	6.57	5.29
Profit for period		\$0.86	\$1.10	\$1.11	\$1.07	\$1.05	\$1.04	\$1.01	\$0.99	\$8.23	\$0.96	\$0.92	\$0.88
Return per bushel of corn		\$2.16	\$1.82	\$1.73	\$1.62	\$1.54	\$1.50	\$1.45	\$1.41	\$1.60	\$1.37	\$1.32	\$1.28

The above financial results are based on a price of \$10.00 per 100 pounds for hogs at the farm. It is an interesting fact as shown above that altho the cost of feed both daily and per pound of gain increases as the weight of the hog increases, the daily profit also increases up to a weight of approximately 225 pounds as an average. There are, however, exceptions to this rule. Such an exception will result from a failure of appetite, in which case the amount of feed eaten daily would remain fairly constant or decrease, while the amount of feed eaten for each pound of gain made would increase very likely to such an extent as to make feeding unprofitable.

BALANCED RATIONS FOR MARKET HOGS

Below is shown a simple, convenient, and economical method of balancing the feed for market hogs when the supplemental feed is given by hand.

Do not in any case allow more than one pound of either A or B mixture daily to each pig, and never that much unless they are getting all the corn they will eat either by hand or through a self-feeder.

Pigs should be grouped according to size; variation in the individual weight of pigs in the same group should not exceed 25 pounds.

FOR PIGS WEIGHING BETWEEN 30 AND 100 POUNDS

Give each pig one pound of the following mixture in the form of a thick slop, daily, and all the corn they will eat at least twice daily.

MIXTURE A.

Variety	Pounds	Price	Cost
Fish meal or 60% tankage	28	\$3.50	\$0.98
Red Dog	20	2.50	.50
Cottonseed meal (37%)	12	2.25	.27
Corn meal	40	2.00	.80
Total	100		\$2.55

FOR PIGS WEIGHING BETWEEN 100 AND 300 POUNDS

Give each pig one pound of the following mixture in the form of a thick slop, daily, and all the corn they will eat at least twice daily.

MIXTURE B.

Variety	Pounds	Price	Cost
Fish meal or 60% tankage	35	\$3.50	\$1.23
Red Dog	25	2.50	.62
Cottonseed meal (37%)	15	2.25	.34
Corn meal	25	2.00	.50
Total	100		\$2.69

Mixture B is the basic mixture. The addition of corn meal equal to 25% by weight of any quantity of Mixture B makes Mixture A. Thus the addition of 25 pounds of corn meal to the 100 pounds of Mixture B shown above will result in 125 pounds of Mixture A.

MINERAL MIXTURE

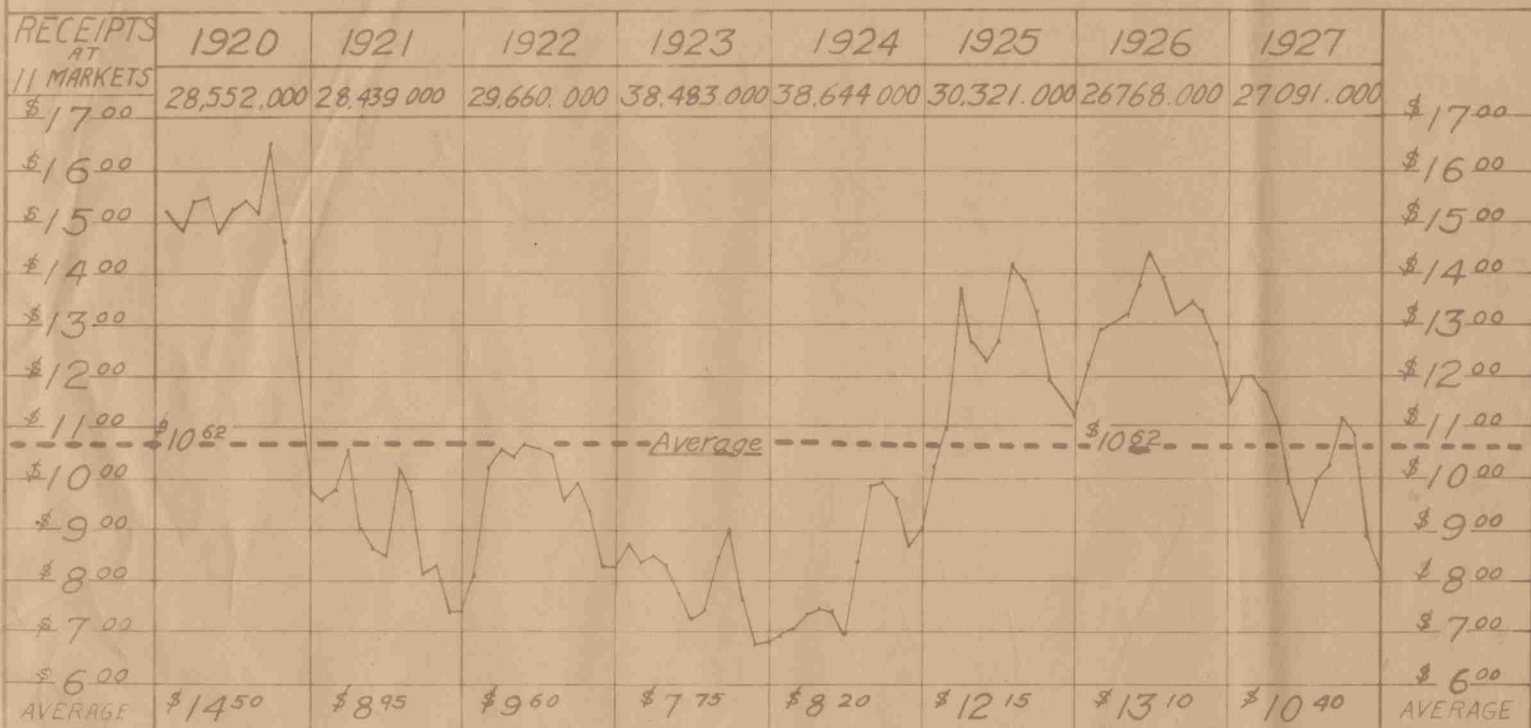

Acid phosphate	10 pounds
Hardwood ashes, or ground limestone	10 pounds
Common salt	2 pounds
To make	22 pounds

Keep the mineral mixture constantly available to the hogs, or thoroughly mix 2 pounds with each 100 pounds of Mixtures A. and B.

NORTH CAROLINA STATE COLLEGE OF AGRICULTURE AND ENGINEERING

OFFICE OF SWINE EXTENSION

AVERAGE MONTHLY AND YEARLY PRICES OF HOGS FROM JAN. 1, 1920 TO JAN. 1, 1928
 — YEARLY RECEIPTS AND —
 AT 11 MARKETS.

OFFICE OF SWINE EXTENSION, N. C. STATE COLLEGE OF AGRICULTURE AND ENGINEERING.

SEASONAL TREND of HOG PRICES

AVERAGE OF EIGHT YEARS' PRICES OF HOGS BY MONTHS AT CHICAGO
AND
AVERAGE OF MONTHLY RECEIPTS AT 11 MARKETS, 1920-1927.
SOFT HOGS \$1.00 ^{each}, OILY HOGS \$2.00 PER 100 ^{lbs} LESS THAN PRICES SHOWN

A DOLLAR-AND-SENSE VIEW OF THE ABOVE CHART.

At the average of eight years prices, a 200 pound hard hog sold during September for \$22.82. An oily hog weighing 300 pounds sold during December for \$20.94.

The 200 pound hog if full fed a properly balanced ration, returned approximately \$8.00 profit; the 300 pound oily hog was produced at a LOSS. Why add the oily 100 pounds?

Office of Swine Extension, N.C. State College of Agriculture & Engineering.

SHOWING THE EFFECT OF RATE OF GAIN ON PROFIT

The delusion of "cheap gains" is costing the farmers of North Carolina thousands of dollars annually. Lot 6 below, shows the result of feeding 15 pigs 2 pounds of corn daily per 100 pounds of live weight. Lot 7 shows the result of self-feeding corn and tankage to a similar lot. The pigs in both lots averaged 77.6 pounds at the beginning of the 93 day feeding period. Both lots were on good alfalfa pasture, which is charged at \$15.00 per acre; corn is charged at \$0.75 per bushel, and tankage at \$70.00 per ton. Gains are credited at \$10.00 per 100 pounds.

Lot		Cost of gain \$70.85	VALUE of gain \$105.84		VALUE of gain \$252.84
6	½ ration of corn, daily	Corn \$40.85	Past. \$30.00	Profit \$34.99	
7	Self-fed corn and tankage	Concentrates \$133.25		Past. \$11.25	Profit \$108.34

THE "CHEAP GAINS" MYTH EXPLODED.

As will be seen by a study of this page, limited-fed pigs require about three times as much pasture and make less than half the gains as do pigs self-fed a balanced ration; and when the pasture is charged against them, the gains made by the pigs in Lot 6 cost \$3.86 for concentrates and \$2.83 for pasture, a total cost of \$6.69 per 100 pounds as compared with \$5.27 for concentrates and \$0.44 for pasture, or \$5.71 per 100 pounds gain in Lot 7.

WITH CHARGE FOR PASTURE OMITTED

Cost of concentrates per 100 lbs. gain	Value per 100 pounds	Profit per 100 pounds	Gain per pig	Profit per pig	Profit per lot	PROFIT INCREASED BY FULL FEEDING		8 WELL FED PIGS WERE ALMOST AS PROFITABLE AS 15 LIMITED FED PIGS.
						Per pig	Per lot	
Lot 6	\$3.86	\$10.00	\$6.14	71 lbs.	\$4.33	\$64.99	\$3.66	\$54.60
Lot 7	\$5.27	\$10.00	\$4.73	169 lbs.	\$7.99	\$119.59		

THE ABOVE SHOWS CLEARLY THAT THE CHEAPEST GAINS ARE NOT NECESSARILY THE MOST PROFITABLE. AS LONG AS TIME REMAINS THE MEASURE OF PROFIT, RATE OF GAIN WILL BE IMPORTANT.

Adapted from Table 7, Nebraska Bulletin 214 by W. P. Snyder. A similar experiment conducted at Purdue University Experiment Station by C. M. Vestal, gave almost identical results.

HOGGING DOWN CORN AND SOYBEANS

Below is shown the average of five years' results of experiments conducted by the Missouri Agricultural Experiment Station with hogging down corn supplemented with tankage; corn and soybeans supplemented with tankage; corn and soybeans without supplement; and corn alone.

Thirteen shoats averaging 114 pounds, harvested each acre in about 22 days. The crop is charged at \$19.00 per acre and the tankage at \$70.00 per ton. Gains are credited at 10% per pound. The acid test of Profit is used for comparison.

LOT	:	1	:	2	:	3	:	4

Assuming that two and a half days of man labor were sufficient to produce the crop, and that one day would be sufficient to care for the hogs during the 22 days they were in the field, THE PROFIT PER DAY OF MAN LABOR DEVOTED TO RAISING THE CROP AND FEEDING IT would be about as follows:

	LOT 1	LOT 2	LOT 3	LOT 4
	7.47	\$6.53	\$3.23	\$2.46
If made "soft" by the soybeans, profit per day would be:	\$7.47	3.80	2.37	2.46
If made "oily" by the soybeans, profit per day would be:	7.47	2.43	1.50	2.46

THREE REASONS WHY NORTH CAROLINA HOGS DO NOT PAYHigh Cost of Production; Slow Rate of Gain; Low Quality of Product

The above three reasons for the unattractive returns from hogs in North Carolina may, in many instances, be expressed by one compound word--SOYBEANS.

As shown by Form 36, the return in profit per day of human labor devoted to raising and hogging a crop was reduced \$4.24 by dependence on soybeans as a supplement to corn, not considering the effect of the beans on the quality of the carcass. That alone is sufficient to discourage the raising of soybeans for hog feed.

Hogs, made "soft" or "oily" by eating soybeans are docked \$1.00 to \$3.00 per 100 pounds, accordingly. This dockage added to the high cost of producing them, makes the production of such hogs unprofitable, except during a period of high prices, and always at a heavy loss of potential profit.

RETURNS FROM A CAR OF HOGS SHIPPED TO RICHMOND, VA., MAY 5, 1927

GRADE	No.:	Total	Average:	Price	Deduction:			Net	Cost of:	Profit#:	Profit#:	Total

Hard	32:	5625	176	\$10.73	\$603.61	\$36.52	\$12.06	Hard	\$555.03	\$9.87	\$0.86	\$2.87	\$5.04	\$161.28
S														
S & Oily	53:	7575	143	9.88	748.52	49.18	12.25	\$134.62	552.47	7.29	0.81	0.29	0.41	22.22
Both	85:	13200	155	\$10.24	\$1352.13	\$85.70	\$24.31	\$134.62	\$1107.50	\$8.39	\$0.83	\$1.39	\$2.16	\$183.50

#Assuming that, including all charges, it cost \$7.00 per 100 pounds to produce the hogs.

On the basis of \$7.00 per 100 pounds cost of production, 32 hogs intelligently handled paid \$139.06 more profit than 53 hogs sold from the same car, which had been produced in the customary way. Dockage \$1.78 per 100 pounds.
